

DESCRIPTION

The JD jet air diffusers are used for supply air applications, in particular in auditoriums, industrial buildings and factories where a high velocity or 'spot' pattern is required.

Jet diffusers can be installed in horizontal and/or vertical applications.

For adjustment of direction and pattern, the entire core can be rotated 180° with ease at the face of the unit to achieve either a diffused or straight air pattern.

The throw of air in the straight air pattern is twice of the diffused pattern.

CONSTRUCTION

Manufactured from spun aluminium.

Standard finish is white satin (other finishes available upon request).
